

Truss Jibs

Truss Jibs - Truss jib's could be utilized to be able to carry, transport and place trusses. The additional part is designed to operate as an extended jib additional part together with a pyramid or triangular shaped frame. Normally, truss jibs are mounted on equipment like a skid steer loader, a compact telehandler or a forklift using a quick-coupler attachment.

Older models of cranes have deep triangular truss jibs which are assembled from standard open structural shapes which are fastened with rivets or bolts. On these style jibs, there are few if any welds. Each and every riveted or bolted joint is susceptible to rust and thus requires regular upkeep and check up.

Truss jibs are made with a back-to-back arrangement of lacing members separated by the width of the flange thickness of an additional structural member. This particular design causes narrow separation amid the smooth exteriors of the lacings. There is limited access and little room to preserve and clean them against corrosion. A lot of bolts loosen and rust in their bores and must be replaced.
